

## TECHNICAL UNIVERSITY OF MOMBASA

---

FACULTY OF ENGINEERING AND TECHNOLOGY  
DEPARTMENT OF BUILDING & CIVIL ENGINEERING  
**UNIVERSITY EXAMINATION FOR:**  
BACHELOR OF SCIENCE IN CIVIL ENGINEERING

### **ECE 2406 FOUNDATION ENGINEERING 1**

SPECIAL/SUPPLEMENTARY EXAMINATION  
**SERIES: SEPTEMBER 2018**  
**TIME: 2 HOURS**

#### **Instructions to Candidates**

You should have the following for this examination

*-Answer Booklet, examination pass and student ID*

This paper consists of five questions.

Attempt question ONE (Compulsory) and any other TWO questions.

**Do not write on the question paper.**

#### **QUESTION ONE (COMPULSORY) 30 Marks**

- a) Draw a neat sketch of a Mohr circle for a cohesionless soil behind a vertical smooth retaining wall. From your sketch:-
- Explain what points on the Mohr circle that represent the lateral pressure and the vertical pressure for the soil at various depths.
  - Derive the relationship of the vertical pressure and the lateral pressure
- [7Marks] a)**
- b) A retaining wall 7.5 metres high retains a cohesionless back fill. The top three metres of the fill has a unit weight ( $\gamma$ ) of  $18\text{kN/m}^3$  and an angle of internal friction ( $\phi$ ) of  $35^\circ$ . The rest of the fill has a unit weight  $24\text{kN/m}^3$  and angle of internal friction equal to  $20^\circ$  and  $C = 10\text{kN/m}^2$ . Determine the total thrust on the wall and its point of action.

**[13Marks]**

**ANSWER ANY TWO QUESTIONS FROM THIS SECTION**

**QUESTION TWO (20 Marks)**

- a) Figure Q2ashows a trial slip circle.
- On the given figure, sketch a few slices which would be used in slope stability analysis
  - With reference to the figure and your sketches explain the method of slices in slope stability analysis.

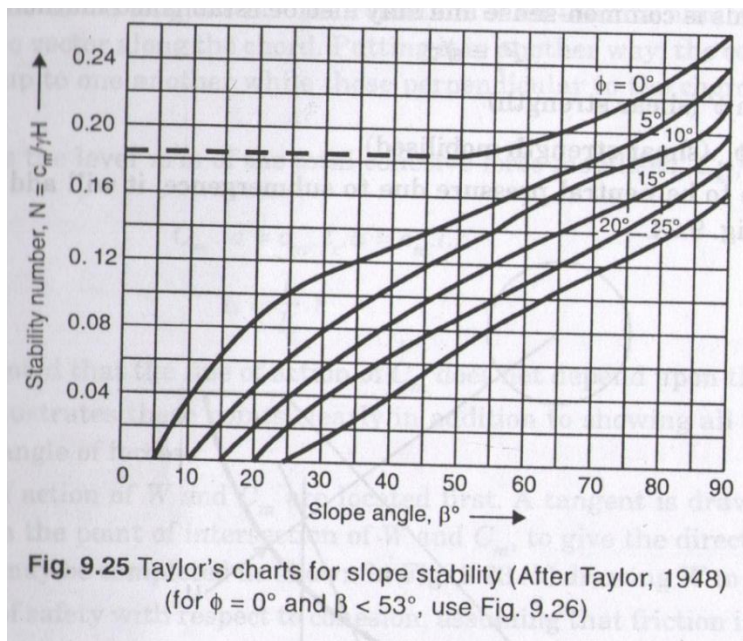

[8marks]

- b) An embankment has a slope of  $30^\circ$  to the horizontal. The properties of the soil are  $c = 30\text{kN/m}^2$ ,  $\phi = 20^\circ$  and  $\gamma = 18\text{kN/m}^3$ . The height of the embankment is 27metres. Using Taylor's charts, determine the factor of safety of the slope. You are limited to TWO trials only.

[12marks]

**Fig 2aa Trial slip circle**

**Fig. 9.25 Taylor's charts for slope stability (After Taylor, 1948)**  
(for  $\phi = 0^\circ$  and  $\beta < 53^\circ$ , use Fig. 9.26)

### QUESTION THREE (20 Marks)

- a) From first principles derive an equation for the determination of bearing capacity of cohesion less soil based earth pressure analogy  
[4marks]
- b) Write down the Terzaghi's Equation for the calculation of ultimate bearing capacity of a square footing and explain its basis  
[4marks]
- c) A square footing measuring 2 metres by 2 metres is located at a depth of 1.2metres below the surface of a uniform sandy gravel of density  $19.2 \text{ kN/m}^3$  above the water table and  $20.1 \text{ kN/m}^3$  when submerged. The strength parameters with respect to effective stress are  $c^1= 0$  and  $\Phi^1 = 30$ . Find the ultimate bearing capacity for the following conditions
- Water table is well below the foundation
  - Water table rises to the base of the foundation
  - Water table rises to the ground level
  - In a design office with more time and resources what further information would be needed for the estimation of the allowable bearing capacity
- [12marks]

### QUESTION FOUR (20 Marks)

- a) Discuss the occurrence of immediate and consolidation settlement for:
- Cohesionless soils
  - Cohesive soils
- [5marks]
- a) The formula for immediate settlement of flexible foundations was given by Terzaghi (1943) is given below. Explain the basis of the equation and define all the terms

$$s_i = \frac{pB(1-\nu^2)}{E} N_p$$

[5marks]

- b) The plan of a proposed spoil heap is shown below. The tip will be about 20m high and will sit on a thick soft clay deposit ( $E=15,000\text{kN/m}^2$ ). Assume that the density of the waste is  $15\text{kN/m}^2$ . Estimate the immediate settlement under the point A at the surface of the soil.  
[10marks]

Typical values of  $N_p$

<b>L/B</b>		<b><math>N_p</math></b>	<b>L/B</b>	<b><math>N_p</math></b>
