ACH 2208: CHEMISTRY OF S & P BLOCK ELEMENTS

SPECIAL/SUPPLEMENTARY: EXAMINATIONS

SERIES: FEBRUARY 2013

TIME: 2 HOURS

INSTRUCTIONS:

You should have the following for this paper

- *Answer booklet*

This paper consists of **FIVE** questions.

Answer Question **ONE (compulsory)** and any other **TWO** questions

This paper consists of 3 PRINTED pages

Question ONE

- a) (I) Write down the electronic configuration of the following in Spd notation
- (i) K(3) (1mark)
 - (ii) L (12) (1mark)
 - (iii) M(31) (1mark)
 - (iv) N(14) (1mark)
 - (v) O (15) (1mark)
 - (vi) P (8) (1mark)
 - (vii) Q(17) (1mark)
- (II) Which of the elements in aI above
- (i) Forms complexes of the nature $[MCl_4]^{2-}$ (1mark)
 - (ii) Has a high affinity for oxygen and thus forms complexes with it (1mark)
 - (iii) Its ion is highly hydrated and drags in aqueous solution resulting in low conductivity (1mark)
 - (iv) Is weakly metallic (1mark)
 - (v) Is a soft solid (1mark)
 - (vi) Oxidizes the rest of the elements except fluorine (1mark)
 - (vii) Is a diatomic gas (1mark)
- b) Complete the following equations
- (i) $H^- + H_2O \longrightarrow A + B$
 - (ii) $(C \equiv C)^{2-} + 2H_2O \longrightarrow C + HC \equiv C - H$
 - (iii) $N^{3-} + 3H_2O \longrightarrow NH_3 + D$ (4marks)
- c) Explain the following of
- (i) Beryllium forms more complexes than magnesium which also forms more complexes than calcium. Give two examples (3marks)
 - (ii) Borene does not form the B^{3+} cation while Aluminium does (2marks)
 - (iii) Hydrates aluminium compounds are acidic. Illustrate with the use of a balanced chemical equation. (3marks)
- d) State the industrial application of the following
- (i) NH_3
 - (ii) Al
 - (iii) $CaCO_3$
 - (iv) Magnesium (4marks)

Question TWO

- a) (i) Give the name and chemical formula of the ore from which Aluminium is extracted (2marks)
- (ii) State the solvent used in the extraction of aluminium and write its formula. (2marks)
 - (iii) Give reason(s) why the graphite rods are to be replaced time after time in the extraction of aluminium. Write an equation for the reaction taking place. (3marks)
 - (v) State the two major impurities in the extraction of Aluminium and explain how they are removed. (3marks)
- b) (i) Explain FIVE properties of Aluminium (5marks)
- (ii) Outline FIVE applications of Aluminium (5marks)

Question THREE

Graphite and diamond are allotropes of carbon and are different in many respects.

- a) Explain the differences between graphite and Diamond in terms of
- (i) Bonding and structure (6marks)
 - (ii) Conductivity (2marks)
 - (iii) Density (2marks)
 - (iv) Applications (4marks)
- b) With reference to the electron pair repulsion theory predict the shapes of the following molecules and ions
- (i) NH_3 (1 ½ mark)
 - (ii) NH_4 (1 ½ mark)
 - (iii) CO_2 (1 ½ mark)
 - (iv) H_2O (1 ½ mark)

Question FOUR

- a) Explain any FIVE special features of nitrogen that makes it different from the rest of the elements in group VB (10marks)
- b) Explain the following
- (i) Phosphine is less soluble than NH_3 (2marks)
 - (ii) NH_3 has higher boiling point than PH_3 even though it is heavier. (2marks)
 - (iii) PH_3 is more acidic than NH_3 (1mark)
 - (iv) BiH_3 is a better reducing agent than the rest of group VB hydrides (2marks)
- c) Outline any THREE applications of nitrogen (3marks)

Question FIVE

- a) Give reasons for the following
- (i) Water boils at 100°C while H_2S is a gas at room temperature. (3marks)
 - (ii) SiO_2 is a high melting point solid while CO_2 is a gas at room temperature. (3marks)
 - (iii) HF boils at higher temperature than HCl (2marks)
- b) Phosphorus forms trivalent and pentavalent compounds. Explain with use of appropriate diagrams. (6marks)
- c) (i) Draw the open structure of water (2marks)
- (ii) Give reasons why water is a universal solvent (2marks)
- (iii) State TWO applications of sulfurs (2marks)
